

Section 1: What the Mustard Seed App Is and Its Purpose

The Mustard Seed app is a digital accountability and growth system built to help users connect daily actions to long-term transformation. It blends reflection, tracking, and encouragement into one ecosystem that bridges fitness, mindset, and life balance. The core purpose is to help users build consistency, celebrate small wins, and reconnect with their sense of purpose through daily practice and feedback.

It isn't just a workout tracker. It's a self-development mirror — a space where users see their own growth take root. Every log, reflection, and milestone reinforces the message that small steps grow into lasting change. The app becomes a living metaphor: faith, effort, and patience combine to move users from seed to strength.

Jae M. Seed serves as the digital **Accountability Partner** throughout this process — a steady, conversational presence who helps users interpret their data, celebrate progress, and reset focus when they drift. He appears in different forms across pages but always with the same tone: grounded, intelligent, and encouraging.

Section 2: Identifying the Feel for the Mustard Seed App

The Mustard Seed app should feel *alive, grounded, and personal*. Each screen is meant to feel like a calm conversation — never sterile, never loud. It carries the tone of quiet progress: clean design, warm colors, natural movement. Users should feel seen, not managed.

Visual tone: balanced whites and earth tones, with hints of green and gold for growth and progress. Motion is subtle but purposeful — screens glide, not jump. Fonts are clean and human, nothing robotic.

The emotional tone is encouragement over pressure. Feedback should sound supportive and thoughtful, as if a wise friend is reflecting back what the user has accomplished. That tone should remain steady across all components, whether the user is viewing data, journaling, or checking progress.

Section 3: The Value in Each Page (with Jae's Presence)

- **Home Screen (One-Time Welcome):** The true introduction. Users see this screen only once — Jae welcomes them to the app, introduces the journey ahead, and sets the tone for accountability and growth. Its value is trust-building and orientation.
Jae's Presence: Calm, welcoming, conversational. He explains the purpose of the app and how small steps create long-term change. After this first session, users move forward permanently into the working part of the app.

- **Progress Page (Reflection + Progress Combined):** This is the living space — users see their recorded actions, reflections, and measurable progress together. It combines what used to be separate: reflection logs and growth visuals. This page is also the heart of the app’s gamification system — where the user’s **Mustard Seed** visually grows over time, transforming from a seed into a sprout, then into a full tree as consistency builds.

Jae’s Presence: Helps the user interpret their story — pointing out effort, patterns, and momentum. He reflects back both the data and the emotion behind it, turning logs into insight. As the seed grows, Jae calls attention to visible milestones — sprouting leaves, expanding branches, and full bloom — each visual cue celebrating user progress. The purpose of this page’s design is to make users emotionally invest in their own growth — to help them *want* to see their tree evolve. The gamified visuals create anticipation, encouraging them to keep showing up, take small daily actions, and watch their effort come alive on screen.

- **Calendar Page:** The planner and catalog of progress. It connects consistency to time, showing the rhythm of effort and allowing users to log or review previous actions. Unlike the Progress Page, which is a snapshot of today, the Calendar Page holds the cumulative record — a detailed catalog of everything accomplished across days, weeks, and months. This is where Jae pulls data for context, recovery insights, and summaries. When users ask, “What did I really do this week?” or “How far have I come?” Jae draws from this calendar log to give them an overview in his responses.

Jae’s Presence: Serves as the interpreter of their timeline. He can highlight streaks, recovery gaps, and effort patterns. His tone is balanced — factual but encouraging. Jae celebrates consistency and uses gentle accountability to help users reconnect when the rhythm drops.

- **Assessment Page:** The checkpoint and onboarding flow. It begins right after the welcome screen, walking users through the initial check-in and periodically reappearing as a self-measure tool.

Jae’s Presence: Guides users step-by-step through their first assessment, offering short encouragements or explanations. He also provides **gentle reassessment nudges** based on time since the last assessment — e.g., “It’s been about 90 days since your last check-in. Want to take a fresh one?” or at 6 months for a deeper review. These prompts are configurable in Settings. After scoring, he summarizes results and passes the user to the main Progress experience. The Assessment Page also appears later as part of the user’s profile settings, allowing reassessment at chosen intervals (e.g., every 3 or 6 months). Users can toggle reminders on/off and choose cadence. Jae compares the latest results with earlier ones, highlighting measurable growth or areas that need attention. Each successful improvement contributes to visible growth in the user’s Mustard Seed tree, reinforcing long-term engagement and recognition for continued effort.

Jae surfaces these comparisons on the Progress page and can summarize gains in a weekly message pulled from the Calendar log.

Together, these pages form a growth loop — from intention (assessment), to action and reflection (progress), to organization (calendar), all led by Jae’s consistent accountability and tone.

Section 4: How Each Page Connects — in Code, Feel, and Function

Every page connects through shared *state and story*.

Code: All data flows through a central user context, ensuring that entries, scores, and reflections are persistent and update in real time. The assessment informs the initial setup and the first Jae message. Progress logs update both the visual charts and the calendar. The user’s reflections live within the progress display.

Feel: Transitions between pages should feel natural — as if each screen is a continuation of the last. Moving from assessment to progress should feel like stepping from “starting” into “doing.” Feedback language stays warm and conversational.

Form & Function: - Buttons, cards, and inputs share one design system for visual unity. - The one-time home screen transitions seamlessly into the assessment. - Navigation is circular across progress, calendar, and reassessment, but linear during the initial onboarding. - Every action feeds another part of the app — reflections strengthen progress data, assessments refresh goals, and calendar logs show up as growth points. - Jae’s avatar remains a thread through all transitions — voice, text bubble, or visual cue moves seamlessly with navigation.

In short, each screen is a different expression of the same principle: *growth through small, intentional steps — guided by a grounded digital Accountability Partner*.

Section 5A: Health App Sync & Passive Tracking

The Mustard Seed app integrates with device health services such as **Apple HealthKit** and **Google Fit** to mirror basic activity data (steps, workout sessions, and movement duration). This enables automatic recognition of effort even when the user doesn’t open the app during exercise.

Purpose: To ensure every bit of genuine movement is recognized and logged — reinforcing consistency and fairness.

Function Flow: 1. On daily sync, the app reads step count and workout sessions from linked health data sources. 2. If new movement data exists without a manual entry in Mustard Seed, the app automatically creates a background log (e.g., “*Synced: 8,942 steps*”). 3. The record appears in the **Calendar Page** as part of the cataloged effort and

contributes to streaks and tree growth on the **Progress Page**. 4. Jae can acknowledge these syncs in messaging — for instance: *“I caught your 10,000 steps from yesterday — strong work.”*

User Control: Health sync permission toggles live in **Settings > Notifications & Permissions**. Users can disconnect or limit data types (steps only, workouts only, or both).

Data Integrity: Synced logs are tagged internally as source: 'health_sync' to differentiate from user-entered progress. The agent must ensure these logs follow the same storage schema (CalendarLog and ProgressEntry types) to maintain system coherence.

Section 5: Global Architecture & Code Contracts (No Placeholders)

Additions for reminders and summaries: - Reminder Settings:

settings.assessmentReminderCadence in months (0 = off, default 3). Stored in AsyncStorage. - **Reminder Logic:** On app open and once per day, compute days since latestAssessment.dateISO; if $\geq$ cadence window (e.g., 90 days), surface a Jae prompt on **Progress** as a dismissible banner and in his bubble. - **Weekly Summary:** On Sundays (or user-selected day), Jae offers a “This Week” rundown by reading the Calendar catalog and presenting counts/highlights (streaks, sessions, reflections). Dismissible and viewable on demand from Calendar. - **Messaging Integration:** These summaries and reassessment nudges appear directly in Jae’s messaging thread. Each automated or scheduled message feels conversational — e.g., “It’s been a good week; your consistency is up 15%,” or “It’s been 90 days since your last check-in, want to see what’s changed?” This integration keeps reminders, insights, and encouragement inside one familiar dialogue with Jae, strengthening continuity and engagement.

(These are implementation rules; the agent writes the code to honor them.)

Section 6: Settings & Profile Overview

The **Settings & Profile** area acts as the user’s personal control center. It manages preferences, account data, and recurring self-assessment tools, maintaining the link between user identity and app progress.

Purpose: To let users review or modify their personal information, app behavior, and long-term assessment cadence without disrupting their ongoing experience.

Core Components: - Profile Summary: Displays user name, avatar, join date, and most recent assessment date. Users can update their avatar image and basic info. -

Assessment Access: Provides a button or card labeled *“Retake My Assessment”* that routes back to the Assessment screen. Jae frames this as a progress check, not a test.

- **Reminder Preferences:** Toggle to enable/disable Jae's reassessment nudges and weekly summaries. Dropdown for cadence (3 or 6 months). - **Data Management:** Option to clear local data, reset progress tree, or export personal data snapshot to email/Drive. - **Theme & Notifications:** Controls for dark/light mode, notification tone, vibration preferences, and **Notification Settings** section. - **Notification Settings:** Allows the user to manage system and in-app notifications. Toggles include *Daily Encouragement*, *Weekly Summary*, and *Assessment Reminder*. Each toggle determines whether Jae can send pop-ups or quiet notifications for those features.

Data Inputs:** User's profile details, chosen reminder cadence, theme settings, and assessment history.

Data Outputs: Updated preference states stored in AsyncStorage and shared via global context. Assessment retake triggers AssessmentScreen navigation.

Logic & Function Flow: 1. On load, fetch profile + preference data from AsyncStorage. 2. Allow user edits and store them instantly upon change. 3. If "Retake Assessment" selected, record the timestamp and navigate to AssessmentScreen. 4. Jae confirms updates with short, conversational feedback (e.g., "Got it, reminders off for now.").

Connectivity: - Connects to AssessmentScreen for reassessment flow. - Connects to ProgressPage to refresh visible growth tree after profile changes. - Pulls shared state from AppState context to ensure consistent user data across all screens.

Jae's Presence: Friendly and functional — he acknowledges setting updates casually (e.g., "Switched to dark mode; that's easier on the eyes."). When users open the profile, he can surface highlights like, "You joined 92 days ago — look at that streak." This space keeps the tone light, personal, and affirming.
